                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAQ81792 is the B. subtilis biotin operon and flanking sequences, as part of an expression vector it can be used in the recombinant production of biotin (or biotin precursor protein). The biotin can be used as a dietary additive in animal feeds, and as a vitamin supplement for human consumption. Biotin is also useful as a reagent for research, and diagnostic prodcedures.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Biotin genes, and constructs derived from improved production of recombinant biotin use in e.g. dietary supplements

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              alignment_scores:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is used to produce the recombinant DNA compounds CC of the invention. The specification describes a recombinant DNA compound CC expressing recombinant polyketide synthase genes in host cells for the CC production of narbonolide, narbonolide derivatives and polyketides that CC are useful as antibiotics and as intermediates in the synthesis of CC compounds with pharmaceutical value. The DNA compounds may also encode CC a Cl2-hydroxyalse (pick), desosamine biosynthesis and desosaminyl CC transferase enzymes (useful for conversion of ketchides to antibiotics), CC These compounds are also useful for increasing the antibiotic activity CC of a compound relative to the unhydroxylated compound. The recombinant CC host cells are useful as genetic systems that allow rapid engineering CC of the narbonolide polyketide synthase. These would be valuable for CC creating novel ketchide analogs for pharmaceutical applications.
                                                                                                                                                                                                                                                                                                                                                              Align seg 1/1 to: AAA75635

This is contig 002 from the recombinant cosmid pKOS023-27 DNA sequence (see AA256001) which contains a Streptomyces venezuelae DNA insert. The cosmid contains open reading frames which encode the various modules of the narbonolide polyketide synthase (PKS). The invention relates to recombinant DNA containing a coding sequence for a narbonolide PKS. Polyketides are compounds synthesised from 2-carbon units through a series of condensations and subsequent modifications. Modular PKSs are responsible for the production of many antibiotics including picromycin. The narbonolide PKS consists of a loading module, six extender modules, and two thioester domains. Four proteins make up the narbonolide PKS (PICAI, PICAII, PICAII and PICAIV). PICAI includes the loading module and extender modules 1 and 2, PICAII includes extender modules 3 and 4, PICAIII includes extender modules 3 and 4,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Contig 002

The second type II thioesterase domain is found on the PICB protein. The nucleotide sequences encoding all of these proteins can be isolated in recombinant form from the recombinant cosmid pKOSO23-27. Narbonolide is desosaminylated in S. venezuelae to yield narbomycin, the desosaminyl transferase enzyme is required for this conversion, and the desosamine blosynthetic genes are also found in cosmid pKOSO23-27. The recombinant DNA of the invention is used to express, in transformed cells, narbonolide (or its derivatives) or other ketolides (particularly hybrids), which may then be converted (e.g. by other enzymes recombinantly expressed in the same hosts) to polyketide antibiotics or their intermediates. The antibiotics are useful in human or veteriorary medicions
                                                                                                                                                                                                                                                                                                                                                                                              1757

```
CC biologically active variant, where the nucleic acid sequence is not considered from the eryC gene cluster of Saccharopolyspora erythraea or CC Streptomyces antibioticus. The invention also relates to a macrolide biosynthetic gene cluster, or fragments thereof. The macrolide cC biosynthetic gene cluster encodes proteins which synthesise methymycin, narbomycin or a combination of these cC compounds. Recombinant or augmented cells comprising the desosamine cC proteins are useful for synthesis of methymycin, pikromycin, pikromycin and narbomycin. The alternative termination of polyketide crecombinant host cells are useful as the compounds produced by the cc synthesis may be useful to prepare novel antibiotics and cc recombinant host cells are useful as biopolymers, e.g., in packaging or biomedical applications, to engineer pHA monomer synthases or to prepare cC immunosuppressants, agents to treat asthma, chronic obstructive pulmonary chalses as well as other diseases involving respiratory inflammation, cc chieseterol-lowering agents or macrolide-based antibiotics which are castive against a variety of organisms, e.g., bacteria, including cm until-drug resistant pneumococci and other respiratory pathogens, as well cas viral parasitic pathogens or a crop protection agents, as well
                                as viral parasitic pathogens, or as crop protection agents (e.g., fungicides or insecticides) via expression of polyketides in plants. Sequences AAZ87295-Z87302 represent macrolide biosynthetic genes frostreptomyces venezuelae ATCC 15439, which encode proteins AAY77190-Y77197.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an isolated and purified nucleic acid segment comprising a desosamine biosynthetic gene cluster, a fragment or its

Novel nucleic acid molecule comprising mitomycin biosynthetic gene cluster useful for cloning mitomycin biosynthetic genes for elucidating the molecular basis of mitosane ring system biosynthesis

Example 1; Page 255; 399pp; English.

from the mitomycin biosynthetic gene cluster. Mitomycins are a group of natural products that contain a variety of functional groups, including amino benzoquinone and axiridine ring systems. The S. lavendulae mitomycin biosynthetic gene cluster comprises 47 mitomycin genes spanning 55kb of DNA. The invention includes an expression cassette comprising a mitomycin biosynthetic gene operably linked to a promoter, and host cells transformed with the cassette. The nucleotide, and protein sequences and the transformed host cells of the invention result in antiasthmatic, antiinflammatory, cytostatic, immunomodulatory, and antibiotic activities. The nucleotide sequences are used to elucidate the molecular basis for the biosynthesis of the mitosane ring system, as well as to engineer the biosynthesis of novel natural products, e.g. immune-enhancers, immunosuppressants, agents to treat asthma, obstructive pulmonary disease as well as other disease involvinespiratory inflammation, or cholesterol-lowering agents or as antibiotics, anti-inflammatory agents, anti-cancer agents invention relates to isolated and purified nucleic acid molecules

Sequences AAC55782-C55881, AAC55815-C55849 and AAB32485-B32542 represent mitomycin biosynthetic gene cluster DNA sequences and encoded proteins. Sequences AAC5812-C55814, AAC55850-G55856 represent PCR primers used in the cloning of the mitomycin biosynthetic genes.

                                                                                                                                                                                                                                                                                                 The present sequence represents the 6.5kb PvuII fragment of Streptomyces CC longisporoflavus R19 which is involved in the biosynthesis of CC indole-carbazole alkalolis (ICA). The sequence contains five functional CC fragments as indicated in the features table. The DNA or a hybrid CC vector containing it can be used to prepare an ICA or derivatives and CC precursors, either by allowing production in previously incapable CC organisms or by improving yields. In particular, the antibiotic CC staurosporin can be produced. Staurosporin is known to have inhibitory CC activity against fungl, yeasts, and Cc2+/phospholipid-dependent CC setine/threonine protein kinases (PKCs). Staurosporin also has CC antiproliferative activity and can inhibit platelet aggregation. CC The present sequence can also inactivate ICA biosynthesis genes and CC can be used in PCR amplification. An advantage of this is that CC productivity of staurosporin-synthesising Streptomyces is improved CC over natural strains yielding only low concentrations.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1620
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1426
                            This invention relates to isolated and purified nucleic acid molecules from the mitomycin biosynthetic gene cluster. Mitomycins are a group of natural products that contain a variety of functional groups, including amino benzoquinone and axiridine ring systems. The S. lavendulae mitomycin biosynthetic gene cluster comprises 47 mitomycin genes spanning 55kb of DNA. The invention includes an expression cassette comprising a mitomycin biosynthetic gene operably linked to a promoter.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Mitomycin; biosynthesis; mitosane ring system; antibiotic; anti-cancer; anti-inflammatory; immune-enhancer; immunosuppressant; asthma; chronic obstructive pulmonary disease; respiratory inflammation;
                                                                                                                                                                                                                                                                                                                     Novel nucleic acid molecule comprising mitomycin biosynthetic gene cluster useful for cloning mitomycin biosynthetic genes for elucidathe molecular basis of mitosane ring system biosynthesis -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   366

Sequences AAC55782-C55881, AAC55815-C55849 and AAB32485-B32542 represent mitomycin biosynthetic gene cluster DNA sequences and encoded proteins. Sequences AAC55812-C55814, AAC55850-C55855 and AAC55862-C55869 represent PCR primers used in the cloning of the mitomycin biosynthetic genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      sequences and the transformed host cells of the invention result in antiasthmatic, antinflammatory, cytostatic, immunomodulatory, and antibiotic activities. The nucleotide sequences are used to elucidate the molecular basis for the biosynthesis of the mitosane ring system, as well as to engineer the biosynthesis of novel natural products, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          40
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 12249
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            27
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           GCGCCGCGAGCGGCCGCTGCAACGCGTCACGCTGCCGTACGGCGGCGAGG

                                                                                                                                                      CC from the mitomycin biosynthetic gene cluster. Mitomycing are a group of contral products that contain a variety of functional groups, including amino benzoquinone and axiridine ring systems. The S. lavendule comprising a mitomycin biosynthetic gene cluster comprises 47 mitomycin genes comprising a mitomycin biosynthetic gene cluster comprises 47 mitomycin genes comprising a mitomycin biosynthetic gene operably linked to a promoter, can host cells transformed with the cassette. The nucleotide, and protein cantibiotic activities. The nucleotide sequences are used to elucidate the cantibiotics, anti-inflammatory, cytostatic, immunomodulatory, and cantibiotics, anti-inflammatory agents of the mitosane ring system, as well as to engineer the biosynthesis of novel natural products, e.g. cantibiotics, anti-inflammatory agents, anti-cancer agents, chronic constructive pulmonary disease as well as other disease involving crespiratory inflammation, or cholesterol-lowering agents or as crop protection agents (e.g. fungicides or insecticides) as well as comparation as well as other disease involving crespiratory inflammation, or cholesterol-lowering agents or to engineer bipolymers, e.g., in packaging or biomedical applications, or to engineer comparatory and encoded proteins. Sequences AAC55812-C55849 and CC AAB32485-B3342 represent mitomycin biosynthetic gene cluster DNA calculation of the mitomycin biosynthetic genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel nucleic acid molecule comprising mitomycin biosynthetic gene cluster useful for cloning mitomycin biosynthetic genes for elucidating the molecular basis of mitosane ring system biosynthesis \,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          (SHER/)

                     Bacteria signal to one another to coordinate expression of specific genes in a cell density dependent fashion. This "bacterial signalling" is called "quorum sensing and response". Quorum sensing allows a bacterial species to sense its own number and regulate gene expression according to population density. The present sequence is an open reading frame (ORF) of a Pseudomonas aeruginosa quorum sensing controlled gene. Inhibitors of quorum sensing signalling renders a bacterial population more susceptible to treatment. The present invention relates to a method for identifying modulators of quorum sensing signalling in Pseudomonas aeruginosa bacteria. Modulators of quorum signalling in Pseudomonas aeruginosa bacteria infections. P. aeruginosa is an opportunistic pathogen of immunocompromised individuals (burn patients, cystic fibrosis patients, patients undergoing immunosuppressive therapy and patients with AIDS).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                9699

This is part of the Streptococcus antibioticus oleandomycin gene cluster. C The oleandolide polyketide synthase (PKS), also known as C (ORF), designated oleal, olealI and olealII. The PKS is a type I C "modular" enzyme, where each ORF encodes 2 extender modules and the first ORF also encodes the loading module. Each module is composed of at least a ketosynthase (KS), acyl-transferase (AT) and an acyl carrier protein (ACP) domain. The oleandolide PKS loading module contains an inactivated KS, called KS-0, where 0 is the abbreviation for a cyl carrier protein (ACP) domain. The oleandolide PKS loading module contains an inactivated KS, called KS-0, where 0 is the abbreviation for glutamine, present instead of the active site cysteine required for composed decarboxylative condensations between acylthicesters followed by cycles of polyketide macrolactones through multistep pathways involving composed decarboxylation concerns an isolated recombinant DNA compound, comprising a glycosylation to yield oleandomycin, an antibacterial polyketide. The modules 1-4 or 1-6, including an oleandolide PKS operably linked to a promoter. Also discussed are recombinant DNA compound, comprising a promoter. Also discussed are recombinant oleandolide PKS in which the particular, the inactivation is mediated by a change in the KS domain of that renders it incapable of binding substrate (the KS1-0 mutation), crendered by mutation in the codon for the active site cysteine. The cleandolide PKS is asserbly ensemble of conditions and motilides. Heterologous expression of oleandolide PKS in which have useful for synthesizing polyketides, which are useful cas antibiotics and motilides. Heterologous expression of oleandolide PKS corresponding derivatives of erythromycins A-D.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Recombinant DNA compound encoding oleandolide polyketide synthase for synthesizing polyketides comprising a coding sequence for a domain of a loading module or any one of extender modules
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Disclosure; Page 14-26; 86pp; English.

The gene encodes a protein of 396 a.a. The DNA was obtained from the macrolide antibiotic-producing bacterium Micromonospora griseorubida AAA11725CN3/pTYS507. The gene was isolated from the plasmid pTYS507. The protein encoded by this plasmid can be used to produce mycinamicin IV in pTYS507-deficient Micromonospora

The preparation method comprises contacting carbonyl compounds with microbes containing a polyketide synthase gene. Pyran-2-one derivatives can be used as synthetic intermediates for drugs and agricultural chemicals. They can also be used as additives for thermosensible transfer paper. The present sequence encodes the specifically claimed Streptomyces griseus RppA protein, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Preparation of pyran-2-one derivative, used as intermediate and as additive for thermosensible transfer paper, comprises contacting carbonyl compound with microbe containing polyketide synthase gene

                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a method for preparing 1,3,6,8-tetrahydroxynaphthalene comprising using a microbe cell containing an rppA gene encoding actinomycetes polyketide synthase, to convert malonyl CoA as the substrate or a substance which can produce malonyl CoA in the microbe cell to 1,3,6,8-tetrahydroxynaphthalene and recovering it. 1,3,6,8-tetrahydroxynaphthalene is used as a synthetic material for melanine and as an intermediate for drugs and agricultural chemicals. The present sequence encodes the actinomycetes polyketide synthase protein isolated from Streptomyces griseus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Preparation of 1,3,6,8-tetrahydroxynaphthalene for use as a synthetic material for melanine and as an intermediate for drugs and agricultural chemicals, comprises using a microbe and an enzyme \,

The protein is used for preparing hydroxylated compounds useful as hydroxymethylglutaryl co-enzyme A (HMG-COA) reductase inhibitors and hypocholesterolaemic agents.
                                                                                                                                                                                                                                                                                                                                453
